
VERSION 1.0 · USER MANUAL

BibleLive

A complete digital church media assistant: a unified library, voice-driven Scripture detection, five independent display outputs, and one-click live service control — fully offline, on one PC.

Desktop Edition · Windows 10 / 11 (64-bit)

1. What BibleLive Does

BibleLive is a complete digital church media assistant for Windows. It runs entirely offline on one PC and combines four engines under a single Live Service control room:

- **Content Engine** — three full Bible translations ship built in (KJV, ASV and the World English Bible — 66 books each), plus a public-domain hymn collection and editable starter slide sets. Import your own songs and documents (.txt / .docx) with license tracking, and create custom slides (welcome screens, announcements, sermon points).
- **Display Engine** — five independent Display Slots. Each slot outputs a fullscreen window on any monitor, with its own theme (background image, font, colors, alignment, transition effects), an optional **second Bible version** shown side by side, AUTO/MANUAL/LOCK mode, saved themes and display profiles.
- **Voice Engine** — listens through a microphone or mixer, transcribes locally with Whisper (no cloud, no audio ever leaves the PC), and detects Bible references ("John 3:16", "John chapter three verse sixteen") and quoted verses — even mid-sentence while someone reads continuously.
- **Service Control** — plan the service in a queue, approve AI suggestions, show lower-third announcements, blank every screen in an emergency, and keep an automatic log of everything projected.

Everything the AI does is a **suggestion**. Nothing reaches a screen unless a rule allows it (Manual / Assisted / Automatic), and the operator can always take over — Automatic mode keeps a 10-second Undo button. The AI only ever matches content that exists in the library — it never generates Scripture.

2. The App at a Glance

The window has a classic desktop layout: a **menu row** (File / View / Settings / Tools / Help) above a **tab strip** with five pages. Ctrl+1 ... Ctrl+5 switch pages.

Page	What it is for
■ Library	Browse, search, read and import everything: Bibles, hymns, songs, books, documents and your custom slides.
■ Displays	The five output slots: monitors, modes, themes, second version, profiles, and the content pickers.
■ Voice	The live listening console: start/stop, level meter, transcript feed. (One-time audio setup lives in ■ Settings.)
■ Live Service	The control room during a service: session timer, suggestions, queue, announcements, display strip, emergency blank.
■ Settings	One-time configuration: audio & voice, Automatic-mode target, reader animation, data tools, about.

3. The Library Tab

Browse and search everything installed. Filter by type (Bible, Hymn, Song, Slide, Book, Document), sort A-Z / Z-A / by date added, or use **canonical order** (Genesis to Revelation). When the Bible filter is active, version tabs (KJV / ASV / WEB) and Old/New Testament sub-filters appear.

Searching

The search box searches **all content at once**. Type a reference ("John 3:16"), a quotation ("for God so loved the world"), or a hymn line ("amazing grace"). Results show highlighted snippets; click one to read the full chapter or

song.

The Bible reader

Click any Bible book to read it chapter by chapter: jump to any book/chapter, step with the arrow buttons, and optionally enable a fade or slide animation on chapter changes (■ Settings → Bible reader).

Custom slides

- ■ **New slide** creates a slide set: give it a title, add slides, each with an optional heading and text (one line per displayed line).
- By default lines **reveal one by one** on the projector (like bullet-point builds). Untick "Reveal lines one by one" to always show every line and step whole slides — right for welcome screens.
- Three starter sets (Welcome, Announcements, Sermon points) ship built in — edit them for your church.

Importing your own content

- Click **+ Import / Add** (or File → Import content...), then paste text or pick a .txt / .docx file.
- Blank lines separate stanzas or sections; lines like "[Verse 1]" or "Chorus:" become section labels that the display engine can page through.
- Choose a license. Copyrighted or unknown-license content is automatically marked **private** as a safeguard.

4. The Displays Tab

Five Display Slots, each independently controlled. A slot is a fullscreen window that shows scripture, slides, lyrics, images or video on whatever monitor you assign it to.

Per-slot controls

- **Open output** — creates the fullscreen window on the chosen monitor (falls back to the primary monitor with a warning if it is missing).
- **AUTO / MANUAL / LOCK** — whether automation may target this slot. LOCK keeps content on screen no matter what — even a pinned Automatic-mode target is respected.
- ■ **Second version** — show the same scripture in a second Bible version (KJV / ASV / WEB), side by side. Stepping advances both columns in lockstep.
- ■ **Scripture...** — pick a verse by browsing (version → book → chapter → verse → optional **"to verse" range**) or by searching. Picking a verse loads its whole chapter, so Prev/Next walks it.
- ■ **Lyrics...** / ■ **Slide...** — put a song stanza or a slide from your custom sets on screen; Prev/Next walks the whole set.
- ■ **Media...** — show an image or video full screen.

Themes — how a display looks

Each card's ■ style panel controls that display's look: font, size, text and background colors, a **background image**, text alignment, a legibility shadow, and a **transition** (none / fade / slide) played when the content changes. Five built-in presets (Classic, Cathedral, Modern, Lantern, Bulletin) set a whole look in one click.

- **Saved theme templates** — "Save this look as..." captures the whole style under a name; apply it to any display from any slot's style panel. Great for seasons (Christmas vs. regular).
- **Display profiles** (File menu or Displays tab) — save all five slots' monitor + mode layout under a name and re-apply it in one click. Profiles are the room setup; templates are the look.

Keys inside a fullscreen output

Key	Action
Left / Right arrows	Previous / next verse, stanza or slide on that display
Tab / Shift+Tab	Switch keyboard focus between open fullscreen outputs
M	Move this output to the next connected screen
Esc	Close the output (its content stays on the slot)

5. Keyboard Shortcuts

Global shortcuts work system-wide, even when a fullscreen output has focus. They act on the **active display** — select it with Ctrl+Alt+1 to 5 (the card shows a gold star; the output shows a brief blue banner). Works with both the number row and the numeric keypad.

Keys	Action
Ctrl+Alt+1 ... 5	Select the active display
Ctrl+Alt+Right / Left	Next / previous verse, stanza or slide on the active display
Ctrl+Alt+B	Blank / unblank the active display
Ctrl+1 ... 5 (main window)	Switch between the app pages

The full list is always available under Help → Keyboard shortcuts.

6. Settings & the Voice Console

■ Settings — one-time setup

- **Audio & Voice** — audio source (with device re-scan), whether it carries speech only or the mixed church audio, speech sensitivity (auto-adapts to the room), the transcription model (Base = most accurate; Tiny = ~4× faster, more mistakes), and the live matching window. The **audio test** (8 s listen) and the **■ diagnostics report** live here too — run the test before every service.
- **Displays** — the Automatic-mode target: the first display set to AUTO, or always a specific display 1–5 (LOCK is never taken over). Also changeable on the Live page mid-service.
- **Bible reader** — chapter-change animation in the Library.
- **Data** — backup/restore guidance and a button to open the data folder (%APPDATA%\BibleLive).

■ Voice tab — the live console

Pick the listening mode, press **Start listening**, and watch the input level and the live transcript. Detected scripture appears as suggestion cards here and on the Live page.

Mode	Behavior
Manual	Suggestions queue up; you control everything
Assisted (default)	Detected verses appear as cards with SHOW / IGNORE
Automatic	Verified high-confidence matches project themselves onto the target display, with a 10-second UNDO button

Scripture is matched continuously from partial speech — the reader does not need to pause. Everything is processed locally; no audio ever leaves the PC.

7. The Live Service Tab

The control room for running an actual service.

- **Start service** — name it (e.g. "Sunday Morning") or leave blank for an automatic date. A timer tracks the service.
- **AI suggestions** — when a verse is detected, a card appears with the verse text (preview), a confidence score, and SHOW / IGNORE. In Automatic mode cards show ■ auto → Display N with an UNDO button for 10 seconds.
- **■ Queue** — plan the service before it starts: type references ("John 3:16-18") or pick slide/song sets, reorder with ▲▼, and press Show to project an entry onto the chosen display. The queue stays until you clear it.
- **■ Announcement** — a lower-third banner ("Lunch is served in the hall") over any display for 10 s / 30 s / 1 min / 5 min / until hidden. It never touches the content behind it.
- **Display strip** — five tiles showing each slot's live status and current content. Click a tile to make it the hotkey target.
- **EMERGENCY BLANK ALL** — blacks out every display at once; Restore all brings everything back.
- **Auto-recorded log** — every verse, song, slide, image or video shown on any display is recorded with a timestamp and saved with the session; History reopens any past service's log.

8. A Typical Service, Step by Step

Step	Action
Before	Displays tab: open outputs, assign monitors, apply a profile and themes. Live Service tab: fill the queue with today's scriptures and slides.
1	Run the audio test once (■ Settings). Then Voice tab: Start listening.
2	Live Service tab: Start service. Keep this tab open — it is your control room.
3	Opening: Show the first queue item (welcome slide / call to worship scripture).
4	During the sermon: suggestion cards appear as verses are quoted — SHOW them, or let Automatic mode project with Undo. Ctrl+Alt+Right walks the chapter; a second-version display shows both translations.
5	Worship: lyrics on another display; Ctrl+Alt+2 to target it, arrows to change stanzas.
6	Announcements: type the lunch notice, Show banner — it disappears by itself.
7	Emergency: Ctrl+Alt+B blanks the active display; EMERGENCY BLANK ALL blacks out every screen.
8	Afterwards: End service. The full log is saved under History.

9. Files, Backup and Troubleshooting

Where things live

Location	Contents
%APPDATA%\BibleLive\biblelive.db	Your whole library, slides, themes, settings and service history
%APPDATA%\BibleLive\models\ggml-base.en.bin	The voice model (also crash.log and diagnostics live in this folder)

Backup and restore

File → **Backup data...** saves everything above to a single JSON file — use it before reinstalling or when moving to the church PC. **File** → **Restore from backup...** puts it all back (it asks for confirmation first).

Common problems

Problem	Fix
Settings says model not found	The installer bundles the models; if the folder was cleaned, copy ggml-base.en.bin into %APPDATA%\BibleLive\models\ (download links are in the README).
No speech detected in the audio test	Wrong input device selected, or input muted in Windows sound settings. Check the device shows a level meter in Windows while you speak.
Bluetooth microphone missing	Connect it first, then use ■ Re-scan devices in ■ Settings. Use the "Hands-Free" entry, not "Stereo".
Hotkeys do nothing	They are global while BibleLive runs — check no other app has claimed them, and that a display is active (gold star). Digits above the letters and the numpad both work.
A display shows only black	That is the blank state. Press Unblank on its card, or Ctrl+Alt+B. Content stays on the slot.
Preacher talks but nothing happens	Check listening is on and the mode is not Manual. He must quote a verse the library contains — say the reference plainly ("John chapter three verse sixteen") or read the words of a bundled translation.
Automatic mode projected the wrong verse	Press UNDO on the card within 10 seconds — the previous content is restored exactly, and the verse is marked ignored.
A display set to LOCK changed	It should not — LOCK always protects a slot, even from a pinned Automatic target. Check the second-version and style settings are on the slot you think they are.

BibleLive — offline-first, local-data-first. Your library belongs to your church, on your machine.
